

GRM's Infrastructure team can "keep your feet dry"

GRM have an experienced drainage and highways team who can provide everything from feasibility studies to detailed design, and liaise with water companies and highways departments to get your approvals. Our areas of expertise include:

- Flood Risk Assessments — Could your site flood and what can be done about it. Questions answered and mitigation schemes designed.
- Surface Water Drainage including SUD's — How much rain runs off your roofs & roads, and effective designs to dispose of it. Includes soakaways, attenuation systems and flow restriction.
- Foul Water and Highways Drainage — Design of a suitable sewer system to meet the requirements of the adopting authorities. Includes Section 38/278 & 104/185 agreements.
- Junction and Access Road Design — Making sure you can safely get on to and off your site, and have the road adopted.
- Topographic Surveys — A must for detailed design to ensure boundaries, existing services, buildings and levels are located and taken into account in the design.

We can provide an on site inspection service or carry out contract management as well a whole host of other services. We are experienced at submitting the necessary information and getting approvals so that planning conditions can be discharged.

Whether it be one building or a hundred, if you would like some advice, more information or a quotation, please give us a call to discuss how we can help.
